ABSTRACT: The electrical conductivity of the system Sb_2Te_3 - Sb_2S_3 was studied as a function of composition and temperature. The investigation supplements the results of N. Kh. Abrikosov and V. I. Ivliyeva /No further reference given. Note of abstracter/. The experimental procedure is described by D. A. Petrov and V. M. Glazov (Zavodskaya laboratoriya, 1958, No. 1). The experimental results are presented graphically (see Fig. 1). It was found that all alloys of this system are semiconductors in the liquid state. From the appearance of the conductivity-temperature-composition curves, it is

Title : Characteristics of Bone Marrow Specimens of Healthy People Living under the Hot Climatic Conditions of Tashkent.

Orig Pub : Med. zh. Uzbekistana, 1957, No 7, 25-32.

Abstract : Hematoses of 26 healthy people were studied. Of these people, 22 were born in Tashkent or had spent there most of their lives. Myelograms were studied taken from smears, and also, separate counts of leucopoiesis and erythropoiesis were determined in the chamber of elements. Myelograms did not uncover displacements; mean figures did not vary greatly from published findings. Separate counts permit a clearer picture of the basic cell groups' maturation processes than total counts of all myelokaryocytes. -- M.I. Yershovich

TITLE: Nonlinear effects in coherent amplification of spin waves by a beam of charged particles

SOURCE: Zh eksper i teor fiz, v. 51, no. 6, 1966, 1934-1939

TOPIC TAGS: spin wave, charged particle, particle beam, coherent signal, Cerenkov effect, Doppler effect

ABSTRACT: This is a continuation of earlier work (Izv AN AzerbSSR no. 4, 97, 1965 and earlier) dealing with coherent amplification of spin waves by a beam of charged particles. The earlier investigations were made in the linear approximation. The present paper deals with the influence of nonlinearity of the equations describing the interaction between the particle beam and a ferroelectric. It is assumed that the initial amplitude of the amplified spin waves is much higher than the amplitudes of all the remaining waves. The particle motion is considered in the hydrodynamic approximation. The particle density in the beam is assumed small. The unperturbed particle velocity is parallel to the magnetic field which in turn is parallel to the easiest magnetization axis of the ferromagnet. By using Maxwell's equations in conjunction with the equations of hydrodynamics it is shown that in the case of spin-

electric field being directed along the preferred axis of the anti-ferromagnet. When the drift velocity exceeds the phase velocity of the waves, the components of the conductivity tensor reverse sign, and this leads to growth of the spin waves. The growth increment is directly proportional to the conductivity of the ferrite and can reach values 10^{-2} . The authors thank A. I. Akhiezer for a discussion of the work.  ABSTRACT: It is shown that spin waves become coherently amplified
 by an electric current if the electron drift velocity exceeds the
 phase velocity of the spin waves. To determine the interaction be-
 tween the spin waves and the electrons or holes in ferrites and anti-
 ferromagnets, the authors first calculate the dielectric tensor from
 the kinetic equation, assuming that the principal scattering mechan-
 ism is scattering of electrons by impurities. The growth increments
 of the spin waves are then determined for the interaction of spin
 waves with a constant electric current in antiferromagnets, the

L 32950-66

TITLE: Coherent amplification of spin waves in antiferromagnetics by a beam of charged particles

SOURCE: AN AzerbSSR. Izvestiya. Seriya fiziko-tekhnicheskikh i matematicheskikh nauk, no. 4, 1965, 97-102

TOPIC TAGS: antiferromagnetic material, spin wave, charged particle, magnetic permeability

ABSTRACT: Amplification of spin waves by a beam of charged particles in uniaxial ferromagnetics in a magnetic field directed along the axis of the antiferromagnetism (Z axis) is examined. Particle velocity has a longitudinal and transverse component. The interaction of the beam with the spin waves is described by a system of equations consisting of Maxwell equations and the kinetic equation for the distribution function of the particles in the beam. Equations are derived for the tensor of magnetic permeability, frequencies of spin waves and growth increments, and critical velocities for cases when

TITLE: Device for input of information from punched tape with circuit conversion of the digits

SOURCE: AN AzerbSSR. Vychislitel'nyy tsentr. Trudy, v. 3. Baku, 1965, 161-170

TOPIC TAGS: special purpose computer, data input, data conversion, computer component, digital to analog converter, punched paper tape

ABSTRACT: The input device developed by the authors is designed for the input of initial information from punched tape into the immediate-access storage unit of a special-purpose computer. The device performs circuit conversion of decimal into binary numbers. The numbers are represented in the computer by 24 binary digits (including the sign position) with the point fixed before the most significant digit; thus the computer operates with seven-digit proper decimal fractions. The input device is made of serially-produced ferrite-diode magnetic elements with a clock-pulse flow frequency of 30 kc. A standard 17.5-mm telegraphic punched tape is used as the information carrier. The recording on the tape is 5-place binary; every digit of a decimal number written in this code by an ST-35 device occupies one line on the punched tape; this determines the digit-by-digit sequential recording and readout of the number.

ABSTRACT: The authors describe a universal unit intended primarily for the process control in the oil industry, where operating speed is secondary to reliability. The arithmetic unit operates with 24 binary numbers with fixed radix ahead of the highest digit. The numbers are fed sequentially, starting with the lowest digit. The arithmetic unit performs the operation of addition, subtraction, multiplication, division, shift one position to the right or left,

ABSTRACT: The article deals with the use of a group of external magnetic-tape memories to supplement the information that must be stored in the internal operative memory. The system consists of two standard tape recorders (MEZ-15 and MEZ-28A), so modified that control pulses can be used to turn the motors on and off and to reverse the motor. The motors operate at 762 mm per second in both directions. Standard type-II tape is used and the recording density

13 later discharges are utilized for recording the cell addresses of the basic memory store - long address. The following 3 discharges are used for recording the addresses of more operational memory cells in the arithmetical circuit. The remaining 5 earlier discharges are used for recording 31 various operational codes. A list of operations performed by LEM-1 is given. All operations carried out by the computer are described in detail. It is shown that the rate of feeding the information from the magnetic tape is 6 thousand numbers and commands per minute. ber. The presence of "0" in the discharge becomes the sign of the positive number. For the purpose of controlling the overflow of the discharge grid, one binary discharge, placed after the fixed decimal point, is provided. The computer operates with 16-discharge binary numbers including the sign of the number and the overflow discharge. The principle of operation of the basic elements of the computer and information storage are series-parallel. Apart from the external memory store on a magnetic tape and on a punched tape, the computer includes an internal fast memory circuit for 8192 addresses and 4 cells for more operational conversion in an arithmetical circuit (special memory store). In these cells codes are memorized on registers in a dynamic state. The internal memory store consists of a permanent memory for 7167 addresses and of an operational memory for 1023 addresses. The computer is of single address type for basic internal memory stores and of tri-address type for special memory stores. Application of the single-address system for basic memory stores leads to an essential constructional simplification of the computer. In the computer each command occupies 21 binary discharges.

The operations performed by the universal digital computer ~~LEM-1~~ (LEM-1) are examined. In this computer the binary counting system is used to introduce command numbers and the performance of operations. The numbers are brought in with a fixed decimal point. The decimal point is fixed prior to the earlier discharge of a number. For imaging of numbers, one binary discharge, placed prior to the later discharges of the number, is provided. The presence of "1" in this discharge becomes the sign of the negative num-

TEXT: Certain problems of design and operation of a universal digital computer using ferrite and capacitive elements type ДЭЗУ (DEZU) (long-duration capacitive storage units). Application of storage and logical elements using ferrite cores results in small universal digital computers, being sufficiently simple and suitable for industrial applications. Advantages of ferrite elements in comparison with valve elements are enumerated. The following magnetic elements for use in logical and solving systems are considered:

Circuits with consecutive binary multiplication and division using ferrite elements

SOURCE:

Akademiya nauk Azerbaydzhanskoy SSR. Vychislitel'nyy tsentr. Trudy, v. 1, 1962, 83-95

TEXT:

The authors describe the circuits and operation of three serial ferrite multiplier circuits and of three serial divider circuits. One of each three is the basic circuit, in the other two the time of operation is reduced by a factor of two for a certain number of bits. The general method of reducing the operation time is described, giving in theory an arbitrary reduction factor. A factor greater than two is, however, impracticable owing to excessively complicated circuitry. The respective variants of the circuits were compared by means of the efficiency coefficient O_x which is the product of the time of operation and the number of elements in the basic

pp 23 - 37

ABSTRACT: The output device of a universal digital computer consists of a printing machine and a control circuit. As a printing machine the ST-35 telegraph is used. The control circuit receives the binary code from the digital computer, and converts the binary code into the binary-decimal code, which is then converted into the ST-35 code. The control circuit also works out signals necessary for printing. The design of individual assemblies of the general printing control circuit is considered in detail. All assemblies are built on 3-time magnetic (ferrite) elements working on a 30 kilocycles frequency. Altogether ~ 250 magnetic

How to Construct Electric Simulators of a Petroliferous Reservoir

by means of the periodic repeater block (2). In the EM-8 computer the switching, the stipulation of initial and boundary conditions, the measurement, and the preparation of the network for repetitive switching are performed with the aid of special circuits equipped with electron tubes, which replace the rotating electro-mechanical contactor-relay-type switching units previously employed, which had not proved themselves in practical operation. This permits one to choose a time T_1 simulating the production period of an oil deposit sufficiently small so that the capacity of the condensers attached to the resistor network does not have to be too big and will not require an enlargement of the overall dimensions of the simulator. In the electric simulator EM-8 T_1 changes from 0.1 to 0.002 sec. The electrical fluctuations from the periodic repeater unit are conveyed to the time unit, where the time period T_1 is divided into 100 parts, so that the process may be investigated in the course of any one of these 100 time intervals of T_1 . The electronically measuring instrumentation contains provisions for the photographic recording of the measured function $u = f(x, y, t)$ at crucial points of the simulator network. For this purpose two cathode-ray tubes in parallel are employed: one, a large-diameter 13LO36 tube, which serves as the principal tube, the other an auxiliary small-diameter 8LO29 tube. The function $u = f(x, y, t)$ is photographed from the principal tube, while the visual observation is done on the auxiliary tube. Visual observation and measurement of

(K voprosu konstruirovaniya elektricheskikh modeley neftyanogo
plasta)

PERIODICAL: Izv. AN AzSSR, 1955, Nr 8, pp 3-10

ABSTRACT: A schematic description is offered of the construction of the electrical simulation model (analog computer) EM-8 for the solution of the nonstationary processes of the filtration of oil in reservoir conditions that are described by differential equations in terms of partial derivatives of the Fourier type. A schematic model circuit is adduced, which consists of: 1) a resistor network with capacitor units connected therewith; 2) a periodic repeater block with a program-time unit; 3) a block for the inclusion of wells; 4) an "initial-conditions" block; 5) an electronic-measuring-instrumentation block; 6) a block for the discharge of the contents of the model network; and 7) a feed block. For greater simplification of the technique of measurement and an improved accuracy, the simulation process can be quickly repeated

ACCESSION NR: AP4043635

The excitation conditions are derived from the Maxwell equations and the kinetic equation for the particle distribution function in the beam. It is shown that the amplification is particularly large if the resonance condition

$$\omega(k) = k_{\parallel} v_{\parallel} + s\omega_B$$

is satisfied, where $\omega(k)$ -- frequency of spin waves with wave vector k , v_{\parallel} -- longitudinal particle velocity, ω_B -- cyclotron frequency of the electron. The growth increment is proportional to the cube root of the particle density in the beam, provided the density is small. Orig. art. has: 12 formulas. "The authors thank A. I. Akhiezer and K. N. Stepanov for a discussion of the work."

TOPIC TAGS: spin wave theory, coherent spin wave, charged particle distribution, resonance scattering, distribution function, ferromagnetism

ABSTRACT: Unlike an earlier investigation by A. Akhiezer et al. (ZhETF, v. 45, 337, 1963) the present authors studied the amplification of spin waves in a ferromagnet, based on coherent interaction between a beam of charged particles and the spin waves, for the case when the particle velocity in the beam has not only a longitudinal but also a transverse component (relative to the magnetic field).

TOPIC TAGS: ultrasonic wave, molecular interaction, hydrodynamic theory,
kinetic equation, intermolecular force

SUB CODE: 20

ABSTRACT: The article concerns the distribution of ultrasonic waves in binary
mixtures, taking into account the inner force field caused by the total inter-
action of the molecules. The authors base their solution on linearized equa-
tions of generalized hydrodynamics derived from a kinetic equation which takes
into account an inner force field:

$$\frac{\partial \rho}{\partial t} + \rho \frac{\partial u}{\partial x} = 0,$$

$$\rho \frac{\partial c}{\partial t} + \frac{\partial J}{\partial x} = 0,$$

Title : Several Results in the Two-Year Experiments Studying the
Effect of T.S. Mal'tsev's Soil Working System on the Develop-
ment of Yield of Cotton

Orig Pub : S. Kh. Tadzhikistana, 1957, No 3, 10-16

Abstract : The two year experimental results are described of growing
cotton on irrigated sierozem soil planted in square pockets
on the fields of the experimental training farm of the Tad-
zhik Agricultural Institute. Deep non-terraced plowing down
to 42-43 cm. provided a yield increase of 3-4 centners per
ha. as compared to ordinary tilling of 24-25 cm. The use of
soil chiseling in the second year to a depth of 8-10 cm.
provided a cotton yield boost of 6.5-11.7 centners per ha. in
comparison with the ordinary banking method of plowing. The
cotton also ripened earlier. -- S.A. Nikitin

119. INTRAVENOUS INJECTION OF PROCAINE SOLUTION AS A DEPRESSOR TEST IN HYPERTENSIVE DISEASE (Russian text) - Makhmudov O. S. - ZDRAVOOKHR. UZ. 1956, 5 (53-54)

In 37 patients with hypertensive disease (Myasnikov's stages I, II and III) the author studied variations in arterial pressure 5, 10, 20, 30 and 60 min. after a single i.v. injection over 2-3 min. of 10 ml. 0.25% procaine solution. A short depressor effect is most marked in stage I of the disease. In late stages it may not be present and in some stage II and III cases a small rise of arterial pressure may occur. In stage I i.v. injection of procaine may be used for therapeutic purposes in conjunction with other measures. The author recommends i.v. injection of procaine as a depressor test in hypertensive disease in order to determine the stage of the disease.
